Deployment Guide

This section outlines how ADSY Technologies handles deployment for client projects, including environments, hosting options, and release processes.

Deployment Environments

Environment	Purpose
Development	Active development and internal testing
Staging	Client review and QA testing before go-live
Production	Live environment accessible to end users

Standard Deployment Process

- Code is developed and tested in the development environment.
- Once a feature or milestone is complete, it is deployed to staging for client review and QA sign-off.
- After client approval, the release is deployed to production during a scheduled deployment window.
- Post-deployment smoke testing is performed to confirm core functionality on the live environment.
- Clients are notified of deployment completion along with a summary of changes released.

Hosting Options We Support

- Cloud platforms: AWS, Google Cloud Platform, Microsoft Azure
- Managed platforms: Vercel, Netlify, Render, Railway
- Database/backend platforms: Supabase, Firebase, MongoDB Atlas
- Client-managed VPS or on-premise servers (upon request)

API Documentation Overview

For projects that include a custom backend API, ADSY Technologies follows REST API best practices unless a project specifically requires GraphQL or another architecture.

General API Standards

- RESTful endpoint design with clear, resource-based URL structures (e.g. `/api/users`, `/api/orders`).
- JSON as the standard request and response format.
- Authentication via API keys, OAuth 2.0, or JWT tokens depending on project requirements.
- Standard HTTP status codes used consistently (200, 201, 400, 401, 404, 500, etc.).
- Versioned APIs (e.g. `/api/v1/`) to support backward compatibility as the system evolves.

Example Response Format

```
{
  "status": "success",
  "data": { ... },
  "message": "Request processed successfully"
}
```

Full API documentation (endpoints, request/response schemas, authentication details) is provided to clients as a project-specific deliverable, typically via Postman collections or an interactive API documentation tool (such as Swagger/OpenAPI).

Integration Guide

ADSY Technologies regularly integrates client systems with third-party platforms and services as part of project delivery.

Commonly Supported Integrations

Category	Examples
Payment Gateways	Razorpay, Stripe, PayU, PayPal
CRM & Sales Tools	HubSpot, Salesforce, Zoho CRM
Communication	WhatsApp Business API, Twilio, SendGrid
Automation Platforms	n8n, Zapier, Make (Integromat)
AI & LLM Providers	Google Gemini, OpenAI, Anthropic Claude
Analytics	Google Analytics, Mixpanel, Meta Pixel
Cloud Storage	AWS S3, Google Cloud Storage, Supabase Storage

Integration Process

- Requirement gathering to confirm which third-party service and specific features are needed.
- Credential and API key setup, typically provided by the client for their own third-party accounts.
- Development and testing of the integration in a sandbox/test environment where available.
- Production rollout after successful testing and client confirmation.

Troubleshooting Guide

Common issues clients may encounter and initial steps to resolve them. For issues not covered here, please contact support@adsytechnology.com.

Issue	Suggested First Steps
Website or app is down / not loading	Check your internet connection first. If the issue persists, contact support with the exact time the issue started and any error messages seen.
Login or authentication errors	Confirm correct credentials and try a password reset. Clear browser cache/cookies if using a web app.
Slow performance	Note which specific page or action is slow, and whether it happens consistently or intermittently, then report to support with these details.
Payment or checkout failures	Verify payment details and try an alternate payment method. Report persistent failures with the approximate transaction time for investigation.
Data not saving or updating	Refresh the page and retry. If the issue continues, note the exact steps taken before the issue occurred and report to support.
Third-party integration not working	Confirm the third-party service (e.g. payment gateway, email service) is not experiencing its own outage, then report the issue with timestamps to our support team.

For urgent production issues, clients on active maintenance plans should follow the escalation steps outlined in our Support Process and SLA documentation.
